

NAME: Y.BHARGAV

REGNO: 25BDS0152

1)Username generator

```
first = input("First name: ")
last = input("Last name: ")
username = first[:3] + last[-3:]
print("Username:", username.lower())
```

The screenshot shows a Python code editor with the following code:

```
1 first = input("First name: ")
2 last = input("Last name: ")
3
4 username = first[:3] + last[-3:]
5
6 print("Username:", username.lower())
```

The output of the code is displayed on the right:

```
First name: Bhargav
Last name: yarlagadda
Username: bhadda
=== Code Execution Successful ===
```

2)Secret message

```
text = input("Enter a message: ")
secret = ""
for ch in text:
    secret += chr(ord(ch) + 1)
print("Secret Message:", secret)
```

The screenshot shows a Python code editor with the following code:

```
1 text = input("Enter a message: ")
2
3 secret = ""
4
5 for ch in text:
6     secret += chr(ord(ch) + 1)
7
8 print("Secret Message:", secret)
```

The output of the code is displayed on the right:

```
Enter a message: LOIS
Secret Message: MPJT
=== Code Execution Successful ===
```

3)Countdown

```
start = int(input("Start number: "))
while start > 0:
    print(start)
    start -= 1
print("Go!")
```

The screenshot shows a code editor with a dark background. On the left, a Python script is written in a light-colored font. On the right, the output of the script is displayed. The script starts with a prompt 'Start number: ' and takes the input '50'. It then enters a while loop that prints the current value of 'start' and decrements it by 1 until it reaches 0. Finally, it prints 'Go!'. The output on the right shows the sequence of numbers from 50 down to 32, followed by 'Go!'.

```
1 start = int(input("Start number: "))
2
3 while start > 0:
4     print(start)
5     start -= 1
6
7 print("Go!")
```

Start number: 50
50
49
48
47
46
45
44
43
42
41
40
39
38
37
36
35
34
33
32
Go!

4) Duplicate checker

```
nums = input("Enter numbers: ").split()
if len(nums) == len(set(nums)):
    print("No Duplicates")
else:
    print("Duplicates Found")
```

The screenshot shows a code editor with a dark background. On the left, a Python script is written in a light-colored font. On the right, the output of the script is displayed. The script prompts the user to 'Enter numbers: ' and takes the input '50'. It then checks if the length of the input list is equal to the length of the set of the input. Since there are no duplicates, it prints 'No Duplicates'. The output on the right shows the prompt, the input '50', and the output 'No Duplicates', followed by a success message '=== Code Execution Successful ==='.

```
1 nums = input("Enter numbers: ").split()
2
3 if len(nums) == len(set(nums)):
4     print("No Duplicates")
5 else:
6     print("Duplicates Found")
```

Enter numbers: 50
No Duplicates
=== Code Execution Successful ===

5) Random compliment generator

```
import random
```

```
msg = [  
    "Great Job!",  
    "Keep Learning!",  
    "You're Improving!",  
    "Excellent Work!"  
]  
print(random.choice(msg))
```

A screenshot of a code editor with a dark background. The left pane shows Python code:

```
1 import random  
2  
3 msg = [  
4     "Great Job!",  
5     "Keep Learning!",  
6     "You're Improving!",  
7     "Excellent Work!"  
8 ]  
9  
10 print(random.choice(msg))
```

 The right pane shows the output:

```
Great Job!  
  
=== Code Execution Successful ===
```

6) vowel and consonant counter

```
text = input("Enter text: ").lower()  
  
vowels = 0  
consonants = 0  
  
for ch in text:  
    if ch.isalpha():  
        if ch in "aeiou":  
            vowels += 1  
        else:  
            consonants += 1  
  
print("Vowels:", vowels)  
print("Consonants:", consonants)
```

```

1 text = input("Enter text: ").lower()
2
3 vowels = 0
4 consonants = 0
5
6 for ch in text:
7     if ch.isalpha():
8         if ch in "aeiou":
9             vowels += 1
10        else:
11            consonants += 1
12
13 print("Vowels:", vowels)
14 print("Consonants:", consonants)

```

Enter text: Bhargav
Vowels: 2
Consonants: 5

=== Code Execution Successful ===

7) typing speed meter

```

sentence = input("Type a sentence: ")
seconds = float(input("Time taken (seconds): "))
words = len(sentence.split())
minutes = seconds / 60
speed = words / minutes
print("Typing Speed:", round(speed), "WPM")

```

```

1 sentence = input("Type a sentence: ")
2 seconds = float(input("Time taken (seconds): "))
3
4 words = len(sentence.split())
5 minutes = seconds / 60
6
7 speed = words / minutes
8
9 print("Typing Speed:", round(speed), "WPM")

```

Type a sentence: Bhargav is hero
Time taken (seconds): 30
Typing Speed: 6 WPM

=== Code Execution Successful ===

8) Attendance percentage calculator

```

total = int(input("Total classes: "))
present = int(input("Classes attended: "))
percentage = (present / total) * 100
print("Attendance:", round(percentage, 2), "%")

if percentage >= 75:
    print("Eligible for exams")
else:
    print("Attendance shortage")

```

```

1 total = int(input("Total classes: "))
2 present = int(input("Classes attended: "))
3
4 percentage = (present / total) * 100
5
6 print("Attendance:", round(percentage, 2), "%")
7
8 if percentage >= 75:
9     print("Eligible for exams")
10 else:
11     print("Attendance shortage")

```

```

Total classes: 30
Classes attended: 24
Attendance: 80.0 %
Eligible for exams

=== Code Execution Successful ===

```

9)Random subject

```
import random
```

```
subjects = ["Maths", "Python", "English", "Science", "History"]
```

```
print("Today's Subject:")
```

```
print(random.choice(subjects))
```

```

1 import random
2
3 subjects = ["JAVA", "Python", "EDA", "PROBABILITY AND STATISTICS", "COMPUTER
  NETWORKS"]
4
5 print("Today's Subject:")
6 print(random.choice(subjects))

```

```

Today's Subject:
JAVA

=== Code Execution Successful ===

```

10)Password length checker

```
password = input("Enter Password: ")
```

```
if len(password) >= 8:
```

```
    print("Good Password")
```

```
else:
```

```
    print("Password Too Short")
```

```

1 password = input("Enter Password: ")
2
3 if len(password) >= 8:
4     print("Good Password")
5 else:
6     print("Password Too Short")

```

```

Enter Password: idiot in the town
Good Password

=== Code Execution Successful ===

```
